

REGENERATIVE TREATMENT CENTERS

O-Shot

The O-Shot is available at Regenerative Treatment Centers!

The O-Shot is a natural safe way of addressing the physical causes of sexual dysfunction and urinary incontinence in women. These long term effects can be life changing!

Over 50% of the female population suffer from urinary incontinence, painful intercourse & loss of sexual function. These conditions can be due to injuries during pregnancy or childbirth, or from age related conditions and muscular atrophy. 25% of women report some form of incontinence, which can lead to embarrassment and challenges with exercise and sexual activities but often suffer in silence without hope.

Hormones can help with the symptoms, but it is important to know they do not address the cause.

Note: *Some patients suffering from incontinence have been able to go off their medication for incontinence after receiving the O-Shot.*

Patients Report:

- Elimination of pain or discomfort during sexual intercourse
- Less worry about leakage during intercourse
- Decreased vaginal dryness
- Increase in sexual desire
- Stronger and more frequent orgasms
- Reduction or even elimination of urinary incontinence and medications

There are no side effects and patients have tolerated the procedure well. You receive all of the benefits in a pain free, no risk treatment which only takes 30 minutes of your time.

Call 913-951-5900 to schedule your appointment today!

REGENERATIVE TREATMENT CENTERS

What is the O-Shot?

The O-Shot is a painless, natural way to transform your sexuality. Often through aging, sensation may be lost or possibly it was never present in the way you would like. This procedure can restore or enhance that sensation, improving your sensitivity and enhancing your sex life. It also can help restore urinary continence to stop those embarrassing leaks and runs to the bathroom.

The O-Shot is safe, using all natural ingredients. It is painless and only takes 30 minutes or less. It's a non-surgical procedure that can rejuvenate and revitalize vaginal and clitoral function, giving you dramatically improved sensitivity and significantly enhance your sex drive and orgasms.

Your own blood is removed and platelet rich plasma is taken from the blood. The area to be injected is numbed thoroughly so there is no pain or discomfort. The plasma is then mixed with MSCS or Micro Pods and injected back into the patient near the clitoris and the vaginal wall. This mixture stimulates the body to heal and restore the areas injected.

Who is the Procedure For?

Any woman who wants to improve her sexual responses or who suffers from urinary incontinence. Urinary incontinence is a common problem which affects sexual pleasure because of the focus on the embarrassment of urinary leakage. It also affects daily life as it can occur with sneezing, jumping, coughing or physical activity. The procedure increases sensitivity, the ability to have an orgasm, libido and also decreases vaginal dryness thus eliminating sexual pain. Patient responses showed vast improvement in these areas and they reported overall enhanced life function from the O-shot.

What Does the Doctor/Nurse Do?

The O-Shot® procedure begins with the patient having their own blood drawn which ensures that it is natural for your body and there is no risk of rejection. The blood is then treated to extract the growth factors in the plasma. These platelet-rich plasma growth factors are then mixed with MSCS or Micro Pods and injected back into the patient after the area is numbed with an anesthetic cream. The injections are placed near the clitoris and into the upper area of the vagina which stimulates sexual response. There is little or no discomfort during the procedure. It is administered in a safe and sterile environment, making it virtually risk-free.
